

Ghost Effects Dizzy Tone

Thank you for purchasing a Ghost Effects Dizzy Tone, your pedal was lovingly handmade in Birmingham, UK.

Controls.

Attack = Tone, all the way up is bassy, as you turn it down it brings in a high pass filter thinning the sound out and cutting bass.

Balance = It's a bias control but actually works as a level control, adjust to taste depending on where the timbre control is.

Sustain = Fuzz, up for more, down for less, actually controls the amount of signal being sent to Q3, all the way down cuts out the sound.

Keep the balance down low at first til you get a feel for the timbre control as it can get loud with Attack right up.

Power.

Usually a 9V battery.

If you have a 9V DC input installed then use a negative tip 2.1mm supply and don't daisy chain with any negative ground pedals.

Failure to use the right supply may damage your pedal, if in doubt feel free to get in touch via email.

Warranty.

Full lifetime warranty provided minus postage and parts costs.
